Transferable production:
Commit & branches Portfolio

Why?

I use seperate branches for each learning outcome to keep my work structured and organised. To keep this seperate I can focus on one part of the code at the time. This approach has helped me to keep finished and unfinished code separate and prevented me from keeping mistakes. If something goes wrong in a particular branch, then my main branch remains safe.

How?

I made separate branches for each learning outcomes, so whenever I update a learning outcomes or the homepage, pushed my code to the corresponding branch. Every branch reflects a single part of the project. I also created another branch called "updated-documentation" . This helped me to keep old and new documentation seperate

What?

This workflow has helped me to avoid cluttering the main branch and made it clear to me see what is finished and not.

So?

Working with commits and branches has learned me to maintain code organization. It also reduced the risks of messing up the main code, since every branch was a separate part of the whole code.
